ABSTRACT

The choice of implant diameter depends on the type of edentulousness, the volume of the residual bone, the amount of space available for the prosthetic reconstruction, the emergence profile, and the type of occlusion. Smalldiameter implants are indicated in specific clinical situations, for example, where there is reduced interradicular bone or a thin alveolar crest, and for the replacement of teeth with small cervical diameter. Before using a smalldiameter implant, the biomechanical risk factors must be carefully analyzed. Preliminary reports of this type of implant show good shortand medium-term results.

CLINICAL SIGNIFICANCE

Specific clinical situations indicate the use of small-diameter implants: a reduced amount of bone (thin alveolar crest) and where the replacement tooth requires a small cervical diameter. In some cases, the use of smalldiameter implants avoids bone reconstruction.
